

Lijphart expanded: three dimensions of democracy in advanced OECD countries?

ADRIAN VATTER *

Department of Political Science, CIS, University of Zürich, Seilergraben 53, CH-8001 Zürich, Switzerland

This article attempts to examine the relationship between the most important political institutions and direct democracy in 23 modern OECD democracies by expanding Lijphart's concept of majoritarian and consensus democracy. The article updates Lijphart's data collection for the most recent period (1997–2006); it responds to criticisms of Lijphart's measurement of a number of variables and of case selection, and it integrates direct democracy as an additional variable. Based on factor analysis, the main finding is that there are not just two, but three dimensions of democracy in advanced democracies. The horizontal dimension comprises the disproportionality of the electoral system, the number of parties, the executive–legislative relationship, the interest groups, and the degree of central bank independence. In the vertical dimension of democracy, we find federalism, decentralization, bicameralism, the rigidity of constitutional provisions, and the strength of judicial review. The top-to-bottom dimension of democracy comprises the type of cabinet government and the strength of direct democracy. In contrast to earlier research, our empirical analysis furnishes the hypothesis that direct democracy is not a variable that is independent of all other political institutions. While active direct democracy goes hand-in-hand with broadly supported multi-party governments, purely representative constitutions frequently appear in conjunction with minimal winning cabinets.

Keywords: majoritarian democracy; consensus democracy; direct democracy; political institutions; advanced democracies; Lijphart's model of democracy

Introduction

Modern liberal democracies are based on two competing visions of the democratic ideal. On the one hand, the majoritarian principle emphasizes democracy as government by the majority of the people, based on a concentration of power. The consensus principle, on the other hand, promotes the idea that democracy should represent as many people as possible and provide for multiple checks and balances – thereby limiting the power of the central government while providing for the representation of a broader array of interests. Although these democratic types have been criticized by many scholars on conceptual, empirical, and normative grounds (Kaiser, 1997; Bogaards, 2000; Schmidt, 2000; Armingeon, 2002; Tsebelis, 2002; Taagepera, 2003), Lijphart's (1984, 1999) ground-breaking distinction between consensus and majoritarian democracies (based on his 10 features of

* Email: vatter@ipz.uzh.ch

democracy) undoubtedly represents the most influential and prominent typology of modern democracies (Mainwaring, 2001).

Using Lijphart's fundamental distinction between majoritarian and consensus democracy as a starting point, this article aims to further develop its base in three respects:

- In conceptual terms, our study encompasses a broader range of democratic institutions. In addition to the executive-parties and federal-unitary dimensions of democracy, we also include direct democracy, thus taking into account power relations between the governing elite and the population. This aspect has hitherto been neglected, but is becoming progressively more important.
- In methodical terms, we aim for a higher validity and reliability of Lijphart's (1999) democratic features. Both for reasons of comparability and due to the strong significance of Lijphart's types of democracy, our study focuses on achieving a more valid and reliable measurement of those variables which have been particularly strongly criticized in Lijphart (1999).
- Empirically, we perform an up-to-date examination of Lijphart's dimensions of democracy on the basis of the individual political institutions. We examine the most recent period, which was not taken into account by Lijphart (1999) (i.e., the decade from 1997 until 2006) using a most-similar cases design. Our empirical analysis concentrates on 23 advanced industrial democracies that display a comparable degree of economic wealth.

According to Lijphart (1984, 1999), the two types of democracy ideally are diametrically opposed with regard to power distribution. Majoritarian democracy, with its bare majority cabinet, two-party system, disproportional system of elections, unitary and centralized government, as well as additional elements, is, as a basic principle, centered on the concentration of power. Consensus democracy, on the other hand, stresses power sharing on the basis of a broad coalition cabinet, a proportional electoral system, a multi-party system, federal, and decentralized government, strong bicameralism, and other institutions. Although Lijphart's (1999) choice and measurement of individual features of democracy have recently been disputed, Taagepera (2003: 14) rightly states that Lijphart's (1999) prominent typology of democracy and his empirical analysis of modern democracies 'sets a standard for work to come'. Therefore, in accordance with Lijphart's terminology of comparative institutional analysis (1999: 3) and following recent theoretical thought on new institutionalism (Hall and Taylor, 1996; Kaiser, 1997; Rothstein, 1998; Grofman, 2000), the 'institutional rules and practices' of the advanced democracies lie at the heart of our research interest.¹ However, we expand the scope of these rules and practices by examining a pivotal element in empirical democracy research: direct democracy. Although often neglected, it forms the most democratic of decision

¹ In other words, our study focuses not only on the legal 'rules-in-form' (formal institutions), but equally on the 'rules-in-use' (informal institutions) which have centers over time (Weaver and Rockman, 1993).

mechanisms and has increasingly gained importance at the beginning of the 21st century. Today, more and more important questions are being decided by referendum (e.g., recent constitutional changes in Australia, Denmark, Ireland, and Italy, as well as ratifications of international treaties in the European Union), while institutional provisions for referendums are increasingly being added to constitutions in many countries (Scarrow, 2001; LeDuc, 2003; Hug, 2004; Qvortrup, 2005).

Lijphart's (1999) factor analysis on the constitutional features and electoral outcomes of 36 different democracies, produces two dimensions. The horizontal dimension, he identifies, is the executive-parties (or joint-power) dimension, comprising the degree of electoral disproportionality, the effective number of parties, the frequency of single-party government, the average cabinet length, and the interest group system. The vertical dimension, which Lijphart calls the federal-unitary (or divided-power) dimension, encompasses bicameralism, federalism, judicial review, constitutional rigidity, and central bank independence. Lijphart's (1984, 1999) finding, that the concept of direct democracy cannot be linked systematically with his two dimensions of democracy, has been recently confirmed by Grofman (2000: 53). However, to date, there have been very few conceptual attempts to connect Lijphart's two models of democracy with direct democracy (see, Jung, 1996; Vatter, 2000). Even recent research on direct democracy (Suksi, 1993; Butler and Ranney, 1994; Gallagher and Uleri, 1996; Hug and Tsebelis, 2002; LeDuc, 2003; Qvortrup, 2005; Setälä, 2006) has only helped to confirm the conclusions reached by Arend Lijphart (1984: 31) in his pioneering study: 'the concept of direct democracy cannot be regarded as either typically majoritarian or typically consensual'. There has not yet been a successful connection of the basic concept of direct democracy, *both theoretically and empirically*, with Lijphart's two important models of democracy in an international comparison. This paper aims to fill this gap and to provide a convincing answer to the question raised by Lijphart (1999: 217), as to whether referendums should 'be seen mainly as majoritarian instruments or rather as incentives for seeking consensus?'

The paper is organized in six sections. The following section develops a theoretical connection between the most important features of Lijphart's models of consensus and majoritarian democracy on the one hand, and the main instruments of direct democracy on the other. In the third section, our main hypothesis concerning the relationship between Lijphart's institutional variables and direct democracy will be presented. The research design and the variable measurements can be found in the fourth section. The fifth section focuses on the empirical analysis of 23 OECD democracies, with a summary of our theoretical arguments and empirical findings to follow in the sixth and final section.

Theoretical connections between majoritarian, consensus, and direct democracy

Before delving into the investigation, it should be noted that there is no definitive answer to the question of possible connections between direct democracy and the

two basic dimensions of democracy. This is due to the reality that the numerous forms of direct democracy are too manifold and oppositional with regard to their functions and effects. It is therefore necessary to first disaggregate referendums, as they have both majoritarian and consensual characteristics. A convincing answer can only be found if we attempt to classify the direct democratic institutions in theoretical terms, subsequently connecting them to Lijphart's two basic principles of power sharing and power concentration (Jung, 1996; Vatter, 2000, 2002). Although a number of classifications have recently been proposed (e.g., Suksi, 1993; Butler and Ranney, 1994; Hamon, 1995; Uleri, 1996; Setälä, 1999, 2006; Qvortrup, 2000; Hug, 2004), most of these attempts come close to Smith's (1976) basic classification. In light of this fact, it seems reasonable to apply Smith's first criterion (1976), albeit in a slightly more specific form (i.e., to ask the question, who has the right to launch a referendum). Using this criterion, we can derive two basic types of referendums (see also, Jung, 1996; Vatter, 2000):

- Type 1: '*Controlled (passive) referendums*': The government or a parliamentary majority may launch a referendum.
- Type 2: '*Uncontrolled (active) referendums*': Non-governmental actors, a minority of voters or a parliamentary minority may initiate a referendum.

While plebiscites,² and in some cases mandatory referendums,³ can be assigned to the first direct democratic type which Hug (2004: 323) calls 'passive referendums', optional referendums⁴ and popular initiatives⁵ correspond to Type 2. The latter can be also designated 'active referendums' because of the active role played by non-governmental actors (e.g., citizens) in launching them (Hug, 2004: 323). Given this basic distinction, it is now possible, at least in theoretical terms, to establish an initial connection to Lijphart's two concepts of democracy: as the ruling majority has an exclusive right to call for plebiscites, these can be thought of as having the typical features of majoritarian democracy. By contrast, we have popular initiatives and optional referendums: these can be launched from the bottom-up by a small minority of voters or parliamentarians, either to overturn decisions made by the parliamentary majority (optional referendums), or to refer

² The use of the term 'plebiscite' in the literature varies. The following explanations are based on the definition by Suksi (1993: 10): a plebiscite 'may be an "*ad hoc* referendum" for which there exist no permanent provisions in the constitution or in ordinary legislation'.

³ Mandatory (or compulsory) referendums are those acts, which have to be referred to the voters by the majority in government and parliament, as required by the constitution or other legally prescribed norms.

⁴ An optional (or facultative) referendum refers to a ballot measure on a government proposal (e.g., a law) which is held either due to demands from citizens or agents in the representative government (e.g., parliamentary minorities) (Gallagher and Uleri, 1996: 7; Setälä, 2006: 705).

⁵ 'Popular initiatives mean that a certain number of citizens can demand a referendum by signing a petition for a referendum on a legislative change promoted by the sponsors of the initiative' (Setälä, 2006: 706). Only initiatives provide citizens with the opportunity to raise their own issues on the political agenda.

to voters' propositions for laws or constitutional reforms (popular initiatives), thereby circumventing the parliamentary and government majority. The mandatory referendum, which is constitutionally required on a particular type of decision, is located between these two types of direct democracy: on one hand, the government can control the agenda of the mandatory referendum and grant considerable leeway in interpretation, if the terms of the proposal are suitably vague, while on the other hand, the government does not have much control over the initiation of a referendum if the constitution automatically provides for a vote on a range of specified issues.⁶ Therefore, following Setälä (2006: 711), we can place the different forms of direct democracy on a continuum from high (plebiscites), to medium (mandatory referendums), to low (optional referendums and popular initiatives) 'governmental control'.

In order to achieve a more accurate taxonomy of the numerous forms of direct democracy, we need to ask not only who initiates the referendum, but also who has ultimate decision-making authority. So far, we have considered the potential influence of governmental majority and non-governmental minorities only in terms of the initial stages of the decision-making process. We therefore need to continue by considering the rights of majorities and minorities during the final decision phase. In concrete terms, this raises the question of whether the consent of specific quorums is required for the acceptance of a referendum proposal. In this respect, Jung (1996: 633) and Vatter (2000: 174) emphasize the substantial difference between referendum decisions requiring qualified majorities, and those which can proceed on the basis of a simple majority.

Provisions for required referendums frequently stipulate not only simple majorities, but also the consent of qualified majorities. For example, in the federal system of Switzerland, constitutional changes require a majority not only among voters, but also among the cantons, which make up the Federation. As a result of this 'double majority requirement' for constitutional referendums, a citizen's vote in the smallest canton Appenzell Inner Rhodes carries approximately 40 times more weight than a citizen's vote in the canton of Zurich. Therefore, the federalist protection of minorities effectively means that small cantons 'can organize a veto to block democratic majorities' (Linder, 1998: 159). In Australia, there is also a 'double majority' rule: a national majority of voters and a majority of voters in a majority of the States (more than half of the voters in more than half of the States) must vote in favor of a constitutional (mandatory) referendum proposal. In Italy, however, a referendum outcome is only valid if the voter-turnout exceeds 50%. In Denmark, a rejection of a bill transferring some aspects of national sovereignty to an international organization is only valid if at least 30% of the eligible voters reject the bill. If less than 30% vote against a proposal, the proposal is deemed to have been accepted (Hug and Tsebelis, 2002: 479).

⁶ 'The level of governmental control over mandatory referendums depends on the extent to which governments have the authority to interpret the constitution' (Setälä, 2006: 715).

Table 1. A ‘Majoritarian–Consensus’ classification of different forms of direct democracy with concrete examples

Decision rule	Governmental control		
	Government-initiated (high control)	Constitutionally required (medium control)	Initiated by a minority of voters or MP (low control)
Simple majority	Plebiscite (e.g., UK, France)	Mandatory referendum (e.g., Spain, Austria)	Optional referendum (e.g., Denmark)
Simple majority and quorum of participation	Plebiscite (e.g., Netherlands)	Mandatory referendum (e.g., Ireland, Denmark)	Optional (e.g., Sweden) and abrogative referendum (e.g., Italy)
Qualified majority	No example	Mandatory referendum (e.g., Australia, Switzerland)	Optional referendum and popular initiative (e.g., Switzerland)

By considering majority–minority dimensions in terms of both the initiation and decision phase of a referendum proposal, we are able to trace connections between the most important forms of direct democracy and Lijphart’s two models of democracy, as well as develop a ‘majoritarian–consensus’ classification of different forms of direct democracy (see Table 1). While plebiscites with simple majority rules belong to the majoritarian type of democracy, optional referendums and popular initiatives requiring supermajorities display distinct consensus characteristics. The latter are effective instruments that enable non-governmental actors to enforce popular votes which may go against the will of the governmental majority, and which may be regarded as typical power sharing instruments of consensus democracies. Initiatives and optional referendums (for which a simple majority rule applies) are intermediate forms⁷: at the crucial stage of initiation, these instruments display typical consensus features, whilst final decisions are made according to a simple majority principle.

Main hypothesis

Following the logic of veto players theory (Hug and Tsebelis, 2002; Tsebelis, 2002; Hug, 2004), we can argue that the possibility of referendums introduces an additional veto player, which makes significant changes in the *status quo* for the government more difficult. In particular, as barriers for the restraint of the executive, optional referendums and popular initiatives take on the function of powerful veto players, which can delay or prevent governmental decisions, thereby serving to shape the executive’s context of action in a significant way.

⁷ As mentioned before, mandatory referendums are also intermediate forms.

Generally speaking, ‘uncontrolled’ forms of direct democracy introduce a new veto player – the median voter of the population – into the political game and thus block the choices of the ruling government (optional referendum) or upset their priorities (popular initiative). Consequently, we can assume that the government will do its best to reduce the uncertainty caused by uncontrolled referendums. A rational strategy to lessen risks arising from the optional referendum and popular initiative, is to widen the executive formula in order to encompass all parties likely to make efficient use of the referendum, if not co-opted as partners in the governing coalition (Neidhart, 1970). We therefore presume that the threat of direct democracy from below leads to a boosting of executive power sharing. In summation, we hypothesize a strong relationship between the type of government cabinet and the consensual strength of direct democracy: more institutional provisions of uncontrolled referendums lead to a more inclusive government coalition in terms of party composition, which in turn leads to more oversized cabinets. In other words, contrary to Lijphart’s (1984, 1999) and Grofman’s (2000) assumptions, we postulate the hypothesis that direct democracy – alongside the horizontal and vertical dimensions – does not form an absolutely independent third dimension of democracy; the individual forms of direct democracy (in accordance with their majority-consensus characteristics) exist in a systematic relationship with the type of cabinet, which was one variable of Lijphart’s first dimension of democracy (executive–parties). On the other hand, we do not assume any connections between direct democracy and Lijphart’s second dimension of democracy (federal–unitary). In the following sections, we will examine this hypothesis.

Research design and measurements of variables

Our empirical research is based on a *cross-sectional analysis* of relationships between the main political institutions in 23 advanced industrial democracies, between 1997 and 2006. We start by using *factor analysis* to inquire into the most important dimensions underlying political institutions in the 23 most established democracies. Second, a *graphic representation of a multi-dimensional matrix* (‘conceptual map of democracy’) of the 23 democracies further depicts the OECD countries’ politico-institutional characteristics.

Drawing on Armingeon’s (2002) and Schmidt’s (2000: 348) criticism of Lijphart’s (1999) selection of countries, we concentrate our analysis on economically similar countries, namely, the 23 most developed OECD countries. In particular, Armingeon (2002: 88) criticized Lijphart’s selection of 36 democracies with very different levels of socio-economic development: ‘Botswana and Costa Rica are compared with the USA and Switzerland’. This is problematic since political institutions and public policies are shaped by the wealth of a nation. Consequentially, many more of the 36 selected countries with strong consensual elements belonged to the group of socially and economically advanced democracies, whereas among the majoritarian democracies there were only few economically advanced countries. Thus, it seems ‘a much

more prudent procedure to concentrate only on economically similar countries – the OECD countries’ (Armingeon, 2002: 88). The systematic comparison of the most advanced and wealthiest democracies not only has the advantage that it meets the requirements of the most-similar systems research design (Przeworski and Teune, 1970; Lijphart, 1971), and therefore avoids ‘mixing up most similar and most dissimilar case designs’ (Armingeon, 2002: 88), it also enables us to ensure that our empirical findings are based on reliable data, which is often not available for less developed countries (Lijphart, 2002: 109).

Table 2 lists the institutional variables, which we will consider in depth. Taking Lijphart’s (1999) 10 attributes of majoritarian and consensus democracies as a point of departure, we will now briefly introduce the variables used in our empirical analysis. Keeping our theoretical considerations in mind, we pay special attention to the measurement of direct democracy.

Party system

Like Lijphart (1999), we use the Laakso-Taagepera index (1979) to measure the effective number of political parties in the respective parliaments. The Laakso–Taagepera index takes into account the number as well as the strength of the legislative parties and is one of the most widely used indicators for this purpose (Armingeon, 2004). Systems with fewer legislative parties tend to be more majoritarian.

Cabinets

Lijphart (1999) measures the concentration of executive power in terms of the proportion of governments during a given period that were either minimal winning or single-party cabinets. A greater proportion of minimal winning or single-party cabinets increases the likelihood of a greater concentration of executive power and, therefore, tends toward a more majoritarian political system. It should be noted that Lijphart’s category of single-party cabinets includes both single-party *minority* cabinets and single-party *majority* cabinets:

However, these are very different types of cabinets in terms of the consensus-majoritarian logic. A minority government must share power with parliament, as the opposition controls a majority of seats and can unseat the government at any time. In order to pass legislation, a majority of MPs must vote in favor of the government’s legislative proposals. A single-party majority cabinet can largely neglect parliament, as long as the parliamentary party is disciplined and MPs support their leaders in cabinet unconditionally (De Winter, 2005: 10).

Therefore, combining cabinets that work according to a consensual pattern with those that work according to a majoritarian logic into a single variable, is devoid of meaning. Starting from this criticism, we slightly modify the measure of the concentration of executive power. In the case at hand, we aim to achieve a

Table 2. Variables, measurement and data sources

	Variable	Measurement	Data Sources
1	Party system: two party systems vs. multi-party systems	Effective number of legislative parties (Laakso–Taagepera index)	Armington <i>et al.</i> (2006), own calculations based on EJPR Political Data Yearbooks
2	Cabinets: concentration vs. sharing of executive power	Percentage of minimal winning and single-party majority cabinets	Lundell and Karvonen (2003), own calculations based on EJPR Political Data Yearbooks
3	Executive–legislative relationship: dominant executive vs. executive–legislative power balance	Combined index of the constitutional strength of the legislative and effective parliamentary control capacities	Siaroff (2003) and Schnapp and Harfst (2005)
4	Electoral systems: majority and plurality methods vs. proportional representation	Gallagher index of disproportionality	Armington <i>et al.</i> (2006), own calculations based on EJPR Political Data Yearbooks
5	Interest groups: pluralism vs. corporatism	Index of corporatism: sum of centralization and coordination of wage-setting arrangements, trade union density, collective bargaining coverage rate (standardized scores)	Driffill (2006), OECD (2005)
6	Constitutional division of power: unitary vs. federal government	Degree of constitutional federalism (scale of 1 to 5)	Armington <i>et al.</i> (2006), Lundell and Karvonen (2003)
7	Fiscal division of power: centralization vs. decentralization	Share of state and local taxes in total tax revenue (in %)	OECD revenue statistics
8	Parliaments and congresses: concentration vs. division of legislative power	Scale of concentration of legislative power (scale of 1 (unicameralism) to 4 (strong bicameralism))	Vatter (2005), Flinders (2005)
9	Constitutional amendments: flexible vs. rigid constitutions	Scale of the majority required for constitutional amendment constitution (scale of 1 to 10)	Lorenz (2005)
10	Legislative supremacy: absence of judicial review vs. strong judicial review	Scale of the degree to which laws can be reviewed by a constitutional court (scale of 0 to 2)	Lundell and Karvonen (2003)
11	Central banks: dependence vs. independence	Scale of central bank independence (incl. ECB) (scale of 1 to 9)	Sousa (2003)
12	Direct democracy: controlled referendums vs. uncontrolled referendums	Scale of the forms and use of direct democracy (scale of 1 to 12)	See Table 3 in this article

ECB = European Central Bank.

more valid operationalization for a majoritarian democracy, in order to focus only on the duration of minimal winning cabinets and single-party *majority* cabinets during the entire research period. Oversized multi-party coalitions, minority

coalitions, and single-party *minority* cabinets are regarded as merely characteristics of a consensus democracy.⁸

Executive–legislative relationship

Lijphart (1999) measures this variable in terms of the average cabinet duration, in days, for the period in question. A more durable cabinet tends to increase the likelihood of a more dominant executive (*vis-à-vis* the legislature), and therefore tends toward a more majoritarian system. However, it is obvious that the relationship between executive and legislative powers is theoretically, but not logically related to Lijphart's indicator. While an executive can be very stable and a loyal delegate of the parliamentary majority, short-lived governments do in fact probably indicate weak governments, but not necessarily strong parliaments (De Winter, 2005: 11). Their instability may be due to many other factors (see, Müller and Strom, 2000). Furthermore, there are many formal and informal rules that contribute to the power relations between executives and legislatures (agenda-setting power, the rights of the parliamentary committees, etc.), and also tend to serve as appropriate indicators for the executive–legislative relationship (Siaroff, 2003). Therefore, it is not surprising that Lijphart (2003: 20) comes to the conclusion that, of his 10 institutional variables, 'the variable that gave me the most trouble [...] was executive dominance', and frankly admits: 'I am not at all sure that the operational indicator I develop in *Patterns of Democracy* is satisfactory' (Lijphart, 2002: 110).⁹

Due to the strong criticism of Lijphart's operationalization, we introduce a new measurement of the power relationship between the executive and the legislative. A valid measurement of the relationship between the executive and the legislature must take both the constitutional position of the legislative *vis-à-vis* the executive, and the legislature's actual possibilities of control into account. The variable chosen to determine the relationship between the executive and the legislative is based on a combined index, incorporating both the formal legal features of Siaroff's (2003) 'executive dominance' index and Schnapp and Harfst's (2005) effective parliamentary control capacities. Siaroff's (2003) index pools 11 indicators, which Siaroff defines as the factor 'executive dominance over the legislature' on the basis of factor analysis. These indicators include, for example, the degree of government control of plenary agendas, the initiation of legislation, the ability of committees to rewrite legislation, and the power of the prime minister.¹⁰ The Schnapp and Harfst (2005) index is based on an extensive examination of the

⁸ See also, Kaiser *et al.* (2002: 319): '[M]inority cabinets have to be treated according to their actual functioning. This means that – parallel to their higher inclusiveness – the chance of alternation they offer is smaller than it appears at first glance'.

⁹ In particular, Lijphart (2003: 21) has in the meantime become convinced that Cabinet Life 1 is 'simply not a valid indicator of executive dominance in presidential democracies'.

¹⁰ Siaroff's index comes close to the (older) executive dominance measure developed by Shugart and Carey (1992).

effective control possibilities and information resources of the parliaments in two dozen industrial democracies.¹¹ Schnapp and Harfst (2005) combine the information and control capacities measured for each parliament to form an additive index, taking factors such as the number of staff at the disposal of members of parliament, the size of the parliamentary scientific service departments, and the number of permanent parliamentary committees into account. Our combined index for the determination of the power relation between government and parliament is formed by the standardized scores of the sum of Siaroff's (2003) and Schnapp and Harfst's (2005) indices.

Electoral system

Like Lijphart, we use the Gallagher index of disproportionality to measure the degree to which the electoral systems skew the relationship between votes and seats in parliament: the greater the disproportionality, the more majoritarian the electoral system.¹²

Interest groups

Lijphart (1999) uses an index of interest group pluralism developed by Siaroff (1999) based on eight indicators and generates a comprehensive score for 24 countries ranging from 1 (highly pluralist) to 5 (highly corporatist). While some of Siaroff's indicators (1999: 195ff.) refer to formal and informal rules – such as the recognition of peak organizations as social partners at trilateral negotiations and as parties which are integrated into policy-making – others are clearly outcomes of such rules, in particular the number of days lost by strikes. Moreover, the latter are used, as such, by Lijphart (1999: 266ff.) in his analysis of the consequences of institutional arrangements for economic outputs. As such, causes and consequences are based to some extent on identical indicators, which clearly creates a problem of endogeneity (De Winter, 2005: 11). Consequently, it seems advantageous to use an indicator of corporatism, which does not rely on economic output indicators. However, to date, corporatism researchers have been unable to agree on a broadly accepted quantitative measurement concept; rather, there exists a multitude of very different quantitative indicators of corporatism 'which have grown so numerous as to perhaps overwhelm even seasoned researchers in the field' (Kenworthy, 2003: 11). Nevertheless, a systematic comparison of 42 indicators of corporatism shows that all these indicators can at least be grouped

¹¹ In the missing case of Iceland, the parliamentary control capacities were estimated based on Kristjansson (2004) and other sources.

¹² Here we follow Lijphart's reply (2003: 21) to Taagepera's (2003) criticism on his measurement of electoral disproportionality: '[T]he most appropriate measure is simply the actual degree to which elections yield proportional results – regardless of the reasons behind these results (such as the effective threshold and other features of the formal electoral rules, the numbers and relative sizes of the political parties, and various country specific factors). [...] Taagepera and I are in agreement on the suitability of the Gallagher index'.

into four categories according to their main focus: (1) interest group organization, (2) wage-setting arrangements, (3) interest group participation in policy-making, and (4) political economic consensus (Kenworthy, 2003). To avoid the endogeneity problem, we use a narrowly defined measure of corporatism that includes the first three categories, but excludes the fourth (political economic consensus), which is usually operationalized by strike rates (Kenworthy, 2003: 16). Our corporatism index is comprised of the sum of the following standardized indicators: trade union density (percentage of labor force consisting of members of trade unions), the collective bargaining coverage rate (percentage of labor force covered by collective agreement), and the centralization and coordination¹³ of the wage formation process.

Constitutional division of territorial power

With reference to the recent debate on how to measure the territorial division of power (Elazar, 1997; Watts, 1998; Castles, 1999; Keman, 2000; Rodden, 2004), and in order to avoid confusing different concepts of vertical power sharing, we depart from Lijphart's (1999) one-dimensional measurement of federalism and decentralization. Instead, we use two different scales to highlight this dimension – namely, the *federal-unitary* scale, representing the constitutional indicators for the 'right to decide', and the *central-decentral* scale, which indicates the extent to which non-central agencies, in fact, have the 'right to act' (Keman, 2000: 199).¹⁴ The federal-unitary indicator measures the territorial distribution of power between different levels of government forms embraced by the constitution, ranging from 1.0 (unitary) to 5.0 (federal), and also takes the recent institutional changes of territorial power in our sample of countries into consideration (Armingeon, 2004).

Fiscal division of territorial power

We measure the degree of *decentralization* by means of an indicator of fiscal decentralization developed in analogy to Lijphart (1984: 178) and also used by Armingeon (2004), Castles (1999), Keman (2000), Schmidt (2000), and many others. 'This measure [...] is the simplest and most unambiguous measure of the territorial decentralization of the fisc' (Castles, 1999: 33). Fiscal decentralization is equivalent to the proportion of state and local taxes in total tax revenue. The tax-share measure is based on the reasonable assumption that the scope of the activities of the central-state and non-central government can be measured in terms of their revenues.

¹³ Soskice (1990) has argued in an influential article that researchers interested in the effects of wage-setting and bargaining arrangements should focus not only on coordination, but also on centralization.

¹⁴ See, Keman (2000: 222): '[F]ederalism and decentralization are two distinct cross-national variables, which enable the researcher to categorize the cases under investigation in a more meaningful way than is often the case in the literature'.

Parliaments and congresses

For his measurement of the distribution of power within the legislature, Lijphart (1999) uses three features (bicameral vs. unicameral; symmetrical vs. asymmetrical; congruent vs. incongruent) in order to derive an index of bicameralism. Lijphart's scale ranges from 1.0 (unicameral), a majoritarian characteristic, to 4.0 (strong bicameralism), a consensus attribute. Here, we use an updated version of Lijphart's bicameralism index based on Vatter (2005).¹⁵

Constitutional amendments

According to Lijphart (1999: 219), the great variety of constitutional provisions can be reduced to four basic types: approval of a constitutional reform by an ordinary majority (1.0); approval by more than an ordinary but less than a two-thirds majority or ordinary majority plus referendum (2.0); approval by a two-thirds majority or equivalent (3.0); and approval by more than a two-thirds majority or a two-thirds majority combined with other requirements (4.0). The major problem with Lijphart's index is the unsystematic consideration of referendums (see, Lorenz, 2005: 342ff.).¹⁶ In her index of constitutional rigidity, Lorenz (2005) combines Lijphart's scale with the systematic consideration of different voting arenas, implying that non-parliamentary actors must be considered in a systematic way when they explicitly have to consent to an amendment. Therefore, for the following analysis we use Lorenz's sophisticated index of amendment procedures (ranging from 1.0 to 9.5), which takes the different majority requirements, as well the different voting arenas into consideration.

Judicial review

In order to measure the strength of judicial review, Lijphart (1999: 225) uses a four-fold classification based first on the distinction between the presence and absence of judicial review and second, on three degrees of activism in the assertion of this power by the courts. In the case at hand, we use an updated version of Lijphart's scale, ranging from 1.0 (no judicial review), a majoritarian trait, to 2.0 (strong judicial review), a consensual characteristic based on Lundell and Karvonen (2003).

Central bank

To measure the independence of central banks, Lijphart (1999: 235) uses the mean value of the Cukierman–Webb–Neyapti, the Grilli–Masciandaro–Tabellini

¹⁵ For the UK, we also take the new bicameralism index score of 1.75 by Flinders (2005: 79) into consideration.

¹⁶ Other problems exist: for example, in each case, Lijphart (1999) considers the least restrictive legal method for making amendments (see, Lorenz, 2005: 342). However, many constitutions provide for very rigorous procedures for the amendment of core sections, or simply make such amendments an impossibility (e.g., Germany).

and Central Bank Governors' turnover rate indices, all of which are coded from 0 to 1 (i.e., from the lowest to the highest independence). However, Lijphart's overall index for the measurement of central bank independence displays a number of weaknesses. For instance, it is partially based on out-dated data, does not include the Grilli–Masciandaro–Tabellini index for half of the countries examined, and does not take recent developments into account – particularly the formation and strong influence of the European Central Bank (ECB). The following analysis is therefore based on an up-to-date analysis of central bank independence for all OECD states, which also records the degree of independence of the ECB. Sousa (2003), in his new study, considers the staff-related, political, economic, and financial dimensions of central bank independence and pools the total of nine indicators in an overall index of the independence of each of the central banks examined. For those countries which have joined the European Monetary Union and where the national central banks have accordingly decreased in importance, the value of the independence of the ECB is measured from the time of the countries' accession.¹⁷

Direct democracy

On the basis of our theoretical considerations, it is possible to compile an index of direct democracy corresponding to the majority-consensus logic. In doing so, the following applies: the more points awarded, the more consensual the direct democracy in a country. Three criteria are decisive for the determination of the direct democracy index:¹⁸

Governmental control: what instruments of direct democracy are provided for by the constitution?. To answer this first question, we award one point for each basic form of 'uncontrolled referendums' (optional referendums, initiatives) provided for in the constitution. No points, however, are awarded for the plebiscite – the most majoritarian popular right – which is by definition an *ad hoc* referendum, can be initiated at the discretion of the head of government, and is often non-binding. The intermediate form, the mandatory referendum, is valued at 0.5 points according its medium level of governmental control. All in all, a maximum of 2.5 points is possible if a country provides for the mandatory referendum (0.5) and the optional referendum (1.0) as well as the popular initiative (1.0). An attenuated form of the popular initiative in practice is known as the popular petition, or the agenda-setting initiative (valued at 0.5 points), a petition, which must be processed by parliament

¹⁷ The following countries have been members of the European Monetary Union since 1999: Belgium, Germany, Finland, France, Ireland, Italy, Luxembourg, the Netherlands, Austria, Portugal, and Spain. Greece has been a member since 2001.

¹⁸ The correlation coefficient between our index of direct democracy proposed here and the 'IRI Europe Country Index on Citizen law making 2002' (Gross and Kaufmann, 2002) is 0.80 (statistically significant at the 1% level; $n = 18$). This strong relationship should provide an indication of a valid coding.

but does not lead to a referendum. This form of citizen participation exists in Austria¹⁹ and Spain.²⁰ A further specific direct democratic feature is the Italian abrogative referendum, which can be initiated by 500,000 citizens or five regional councils. 'There are no time limits between passing the decision and submitting it to a referendum, Italian voters may veto other than recent parliamentary decisions. The Italian abrogative referendum has in fact many characteristics similar to popular initiatives, as it allows the electors to influence the political agenda' (Setälä, 2006: 707; see also Uleri, 1996, 2002). For this reason, in the case at hand, we treat the Italian abrogative referendum as a popular initiative. Finally, special forms of optional referendums exist in Iceland and Greece, where the President can initiate them if she or he refuses to ratify a project of bill (Uleri, 1996: 228). Due to this majoritarian feature, the optional referendum in Iceland and Greece is not valued in our index.

Decision rule: how are decisions regarding the acceptance or rejection of a referendum reached?. This question involves distinguishing whether a simple popular majority is sufficient for the acceptance of a referendum, or whether qualified majorities or the fulfillment of additional criteria are required. Here, one point is awarded for each form of direct democracy if a qualified majority ('quorum of consent') is required. The intermediate form of voter-turnout requirement ('quorum of participation') is valued at 0.5 points.

Practical use: which instruments of direct democracy were effectively used in practice over the course of last 10 years?. In line with Lijphart's 'institutional rules and practices' approach, we will not only examine the constitutional provisions, but also the practical significance of direct democracy as well. Whether a popular right is prescribed by the constitution but never exercised (e.g., due to overly restrictive barriers regarding signature thresholds or circulation constraints), or whether referendums are actually held and the population is able to regularly influence governmental constitutional and legislative decisions directly is an important distinction to make. In our index, we award one point for the effective use, during the period from 1997 to 2006, of each basic direct democratic form stipulated in the constitution (criterion: at least one referendum issue). Here, a maximum of three points is possible if decisions were made via mandatory and optional referendums, as well as via popular initiatives.

Table 3 provides an overview of the allocation of points for the 23 democracies examined based on the index of direct democracy presented above.

¹⁹ 100,000 signatures are required for a popular petition (*Volksbegehren*) in Austria to be forwarded for processing to the National Council (First Chamber of Parliament).

²⁰ The (so-called) Spanish People's Legislative Initiative has the following characteristics: (a) it does not lead to a referendum call; rather, it is merely designed to permit the people to submit, under some circumstances, non-governmental bills to Parliament on a limited set of issues. (b) Section 87.3 of the Spanish Constitution bans popular legislative initiatives for Organic Acts.

Legend: First rows (per country): X: exists; SM: simple majority required; PQ: quorum of participation required; QM: qualified majority (quorum of consent) required; Numbers: number of corresponding referendum (plebiscite; initiative) issues; -: does not exist/apply. *Second rows* (per country): points awarded. *Sources:* Hug and Tsebelis (2002); Research and Documentation Centre on Direct Democracy, University of Geneva, 2007.

Sample calculation (example): In Switzerland, mandatory (0.5 pt.) and optional referendums (1 pt.), as well as popular initiatives exist (1 pt.). Mandatory referendums and popular initiatives are decided by qualified majorities (1 pt. each); optional referendums by simple majority (0 pt.). All these instruments of direct democracy have been used at least once (1 pt. each). Plebiscites do not exist (0 pt.). The total sum of points assigned to Switzerland is 7.5.

Table 4. Varimax orthogonal rotated factor matrix of the 12 institutional variables in 23 advanced democracies, 1997–2006

Variable	Factor I	Factor II	Factor III
Effective number of legislative parties	0.62	0.06	0.39
Electoral disproportionality	-0.83	-0.08	-0.01
Executive–legislative relationship	0.70	0.38	0.06
Interest group corporatism	0.81	-0.26	-0.03
Central bank independence	0.56	-0.36	0.19
Federalism	-0.07	0.89	-0.03
Decentralization	0.08	0.74	0.14
Bicameralism	-0.27	0.80	0.17
Constitutional rigidity	0.26	0.72	-0.11
Judicial review	-0.05	0.65	-0.10
Oversized cabinets	0.12	-0.12	0.84
Direct democracy	0.04	0.12	0.82

Note: The factor analysis is a principal component analysis with eigenvalues over 1.0 extracted (Kaiser criterion).

Empirical results

The main question that now arises is whether relationships can be observed between the most important political institutions in the advanced democracies. The appropriate method for investigating a set of variables with an ordering structure is factor analysis. Factor analysis allows individual variables, by virtue of their correlations, to be classified into independent groups. This statistical procedure allows us to isolate one or more underlying dimensions of the different variables (Kim and Mueller, 1978).

Table 4 presents the results of the factor analysis with our 12 variables.²¹ The research period covers the years 1997 to 2006; the units examined are the 23 most advanced democracies. The values specified for each variable indicate the factor loadings, which can be interpreted as correlation coefficients between the variable and the first, the second, and the third factors.

The central outcome of the factor analysis is the emergence of three unrelated factors, each of which encompasses a group of variables. The three groups of variables exhibit high factor loadings within, as well as low loadings outside their

²¹ The factor analysis chosen here is a principal component analysis with orthogonal, rotated factor loadings in accordance with the Varimax Criterion. Principal component analysis is the most frequently used technique for the determination of factors. In principal component analysis, the coordinate system, with the factorizing characteristics is rotated so that new axes emerge, successively explaining maximum variance. The orthogonal (right-angled) rotation technique ensures that the factors are independent of each other (reciprocally uncorrelated). Rotation using the Varimax Criterion causes the factors to be rotated in such a fashion that the variance of the squared loadings per factor is maximized.

own group. The strongest variable in the first factor dimension is the disproportionality of the electoral system, which correlates very highly with the first factor, followed by interest group corporatism and the executive–legislative relationship. The number of parties and the degree of central bank independence stand in a somewhat less, but still comparatively strong relation to the first factor. In the second dimension, the federalism and bicameralism variables prove to be the strongest features, followed by the decentralization indicator, the rigidity of constitutional provisions, and the strength of judicial review.²² The third and smallest factor encompasses two variables, namely, the percentage of oversized multi-party cabinets and the consensual strength of direct democracy. With 0.84 and 0.82, respectively, both variables correlate strongly with the third cluster. It is worth mentioning that the results are not driven by the special case of Switzerland. When Switzerland is dropped from the factor analysis, the factor loadings between type of cabinet, direct democracy, and the third factor are still 0.80 and 0.77, respectively. Further robustness tests (Scree-Test, test on linearity, tests on further outliers) show that the results proved in fact to be very robust. Finally, the correlation matrix for all 12 variables (see Appendix 2) reveals overall patterns, which generally correspond to the findings of the factor analysis. Not surprisingly, there are exceptions such as a statistically significant correlation between the effective number of parliamentary parties and the (oversized and minority) type of government cabinet (0.42). In fact, its correlation with direct democracy is only slightly higher (0.46).

What can be interpreted from the findings? The most evident result is the fact that if we take direct democracy into account, not only two, but three dimensions in established democracies emerge. Nevertheless, in contrast to the findings of earlier research (Lijphart, 1984, 1999; Grofman, 2000), the empirical results seem to confirm that direct democracy is not a variable that is independent of all other political institutions, but rather connected to the type of the cabinet government, and – to a lesser extent – to the number of parties. In short, the more developed the institutions and the use of direct democracy, the more likely there are to be broadly supported multi-party coalitions in the countries examined.

In the case of the horizontal dimension of democracy, two results are of particular interest. First, it has been shown that even a completely different (and hopefully more valid) measurement of the power relationship between the executive and the legislature reveals results similar to Lijphart's (1999). A balanced relationship between the executive and the legislature corresponds to a proportional electoral system and a high number of parties in parliament. The second notable result is the positioning of central bank independence in the horizontal dimension of democracy, whereas in Lijphart's (1999) factor analysis it was allocated to the federal–unitary dimension. As such, the present result is also

²² All variables reach the level determined by Pennings, Keman, and Kleinnijenhuis (2003) as the critical threshold value 0.35 (0.5, respectively), and can therefore be described as reliable components of their factor dimensions.

more consistent with Lijphart's original conception of the two democratic dimensions:

My own initial view of the differences between the two dimensions, reflected in the labels that I attached to them, was that the first is a horizontal dimension of institutions operating at the central level, and that the second is a vertical dimension having to do with central–regional–local government relations. Because central banks operate at the central level and appear to have little to do with the vertical dimension, my expectation was that central banks would belong to the executives–parties. But the empirical analysis showed a strong relationship with the cluster of four federal–unitary characteristics instead (Lijphart, 2003: 23).

The present analysis makes clear that Lijphart's initial theoretical considerations in this respect can be empirically confirmed for the most recent data, albeit with an important amendment: besides a horizontal institutional structure on the central–state level and a vertical, that is federal dimension, modern democracies also include a third, top-to-bottom power relation dimension, that is the relationship between the government and the population.

The factor analysis which we have carried out, affords us profound insights into the different dimensions of advanced democracies and conveys much information concerning the latter's most important characteristics. However, the analysis does not yet show the exact location of each country (relative to the others) on the three mutually independent dimensions of democracy. A precise and appropriate way of answering this question would be to graphically represent the three dimensions on a conceptual map of democracy – as Lijphart (1999: 248) has already done.²³ Figure 1, in the form of a so-called *bubble plot* (Jacoby, 1998), represents the countries' locations on a conceptual map formed by the 12 variables along with the three dimensions. The characteristics of the five variables of the horizontal and the vertical dimension can thus be used to place each of the 23 democracies on the conceptual map of democracy shown in Figure 1. The first dimension of horizontal power ('parties–interest groups dimension') is located on the abscissa, the vertical power dimension ('federal–unitary dimension') on the ordinate. Both axes vary between strongly majoritarian (positive values) and strongly consensual (negative values).²⁴ The third dimension (the 'cabinets–direct democracy' dimension) is represented by the size of each bubble, which shows the data point's relative importance. A large bubble represents high values in the third dimension and corresponds to an active direct democracy and oversized multi-party cabinets, whereas a small bubble corresponds to a purely representative democracy and minimal winning cabinets in the given period. The exact (*z*-transformed) scores of each of the 23 countries on the three dimensions can be found in Appendix 1.

²³ This requires a *z*-transformation of the factor values of the variables in order to make them comparable with each other.

²⁴ In order to apply the factors to three dimensions, it was necessary to adjust the signs of the individual variables (see also, Lijphart, 1999: 247).

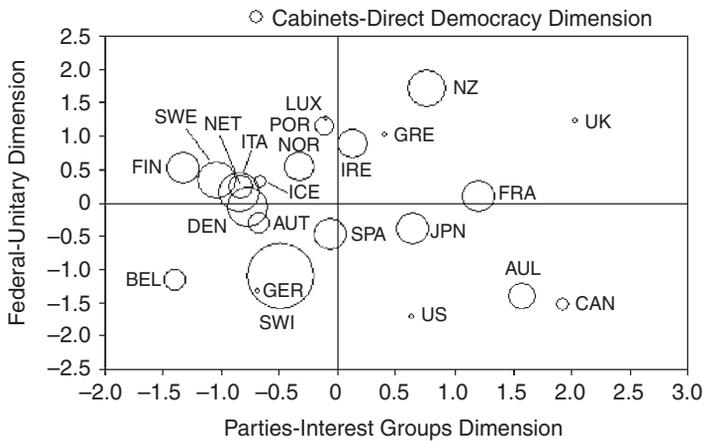

Figure 1 The three-dimensional conceptual map of democracy

What new insights does Figure 1 afford us compared to Lijphart's (1999) two-dimensional map of democracy? Despite recent devolutionary processes in the UK, the UK continues to be a pure example of the Westminster model, while New Zealand (the only more unitary country than the UK) has, due to the introduction of the proportional electoral system in 1996, progressively become a mixed-type in the horizontal dimension, encompassing both majoritarian and consensus elements (Nagel, 2000). In terms of the first two dimensions, the prime example of a consensus democracy within Lijphart's (1999) concept is Belgium, which has in recent years further developed its already exceptional position as a strongly federal state. However, in contrast to Lijphart (1999), Switzerland no longer corresponds to the prototype of a consensual-federal democracy in the first two dimensions. In the horizontal dimension, eight (of 23) countries achieve higher consensus values than Switzerland, while in the vertical dimension, five countries achieve higher values. An important reason for this result is that the present study, with its focus on direct democracy, includes a very important institutional arrangement of Swiss democracy, which, together with the type of cabinet, forms a third dimension. Although Switzerland is an average case of a consensus democracy in the first two dimensions, it represents a prime example of a direct democratic power sharing democracy. The relevant antipodes in the third dimension are purely representative democracies (at the national level) with minimal winning cabinets such as Germany, the USA, and the UK.

Conclusions

Two conclusions can be drawn from our analysis of the most important political institutions in advanced democracies:

First, our empirical results suggest that in consolidated democracies, there exist more than the two well-known dimensions of Lijphart's model of democracy.

Strikingly, the central outcome of our factor analysis is the emergence of three largely unrelated factors. The (first) *horizontal dimension of democracy* comes close, but is not identical to Lijphart's executive-parties dimension. This dimension includes an entirely new measurement of the executive-legislative relationship, as well as central bank independence, and excludes the type of cabinet government. Because central banks operate at the national level, this result is more consistent with Lijphart's initial distinction of a horizontal-vertical contrast (Lijphart, 2000: 236). The second factor is almost identical to Lijphart's federal-unitary dimension and includes federalism, decentralization, bicameralism, constitutional rigidity, and judicial review. We can thus label the second factor *the vertical dimension of democracy*, as it deals with central-regional government relations. Finally, the most interesting result is the existence of a third factor, which we call *the top-to-bottom dimension of democracy*. This third dimension comprises two political institutions, the type of cabinet government and the strength of direct democracy. In contrast to the findings of other studies to date (Lijphart, 1984, 1999; Grofman, 2000), our study reveals that direct democracy is not a political institution independent of all other features of democracy; rather, it exists in relation to the type of the government cabinet, and – to a lesser extent – to the number of parties.

In line with the neo-institutional approach, it seems that with the increased veto potential of direct democracy and the ensuing unpredictability for the respective government, the increased institutional provisions for referendums in advanced democracies and their growing use by non-governmental actors in recent years, created institutional pressures towards more power sharing in the executive. In the case of Switzerland, the development of popular rights has admittedly led to the continuous integration of the main political parties into a government coalition and weakened the parliament. In the quest to minimize the risks harbored by direct democracy, the informal search for a broadly supported compromise has required the formation of broadly supported multi-party governments, which make the important decisions. Extensive power sharing in the Swiss government is intended to produce solutions acceptable to a sufficiently large majority in parliament, for the risk of optional referendums and popular initiatives to be reduced (Neidhart, 1970; Steiner, 1974, 2002; Linder, 1998). In short, the co-optation strategies over the years by the political actors in order to minimize the risks harbored by direct democracy, gradually transformed the Swiss referendum democracy into a consensus democracy with broadly supported multi-party government coalitions. However, we should be cautious suggesting a strong causal relationship between direct democracy and cabinet type in general. While the causal relation between direct democracy and oversized coalitions appears a valid explanation especially for Switzerland (and Liechtenstein), the frequency of oversized coalition in Italy and Denmark may be more explained by the fragmentation of the party system. Nevertheless, according to country experts, the recent integration into government of such parties as the Partito Radicali, Lega Nord, and Verdi in Italy (2005/06) as well as the Conservative Party and the

Radical-Liberals in Denmark in the 1980s, occurred especially in order to prevent these opposition parties from their growing and effective use of referendum campaigns to block government legislation (Svensson, 1996; Uleri, 2002).

Second, how can the present results be integrated into the current findings of empirical democracy research? Initially, our results underline, for the most recent period, the continuing theoretical and empirical relevance of the horizontal and vertical power sharing dimensions in established democracies as described by Arend Lijphart (1984, 1999). At the same time, our results make clear that the inclusion of a direct democracy can lead to an extension and differentiation of Lijphart's concept of representative majoritarian and consensus democracy. Such an extension and differentiation not only accounts for new developments, such as the increased significance of referendums in modern democracies, but also counters certain researchers' criticism of Lijphart that consensus democracies are *de facto* oligarchical elitist democracies without any direct influence by the people. Evidently, in reality there exist *two different prototypes of consensus democracies with different power sharing strategies*: on one hand, *the parliamentary-representative type*, which is decisively influenced by the search for compromises by the elected party leaders in the parliamentary arena (e.g., Belgium); and on the other hand, there is *the direct democratic type*, which is characterized by the broad integration of political forces into the government due to the pressure exercised by instruments of direct democracy (e.g., Switzerland). In this sense, we agree with Kaiser's (1997), Kaiser *et al.* (2002) critique²⁵ of Huber, Ragin, and Stephens (1993) and Schmidt's (2000) one-dimensional frameworks of counter-majoritarian institutions. In the present case, it seems similarly unwise simply to tally up the institutional veto points, as this would cause a practical disappearance of the different dimensions of power sharing and the specific interaction of institutions in the advanced democracies. Theoretically, as well as empirically, it seems more useful to allow for the variety of institutional arrangements in the advanced OECD countries by differentiating between at least three different dimensions of democracy. Taking these different dimensions into account provides us with a more complex, but also an overall more realistic picture of the diversity of modern democracies.

Acknowledgments

I am indebted to Markus Freitag, Arend Lijphart, Theo Schiller, Maija Setälä, Jürg Steiner, and the anonymous reviewers for their advice and criticism. An earlier version of this article was presented at the ECPR-Joint Sessions of Workshops 2007 in Helsinki.

²⁵ Kaiser's (1997) and Kaiser *et al.*'s (2002) concept of multi-dimensional veto-point democracy distinguishes different dimensions of veto points, and refers particularly to the compensatory relations of political-institutional veto points to the containment of majority rule.

Appendix 1. Twelve institutional variables of 23 Advanced Democracies, 1997–2006

Country	Effective number of legislative parties	Oversized and minority cabinets (%)	Index of executive–legislative relationship	Gallagher Index of disproportionality (%)	Index of interest group corporatism	Index of constitutional federalism
Australia	2.47	11	−2.38	10.04	−1.59	5.0
Austria	3.19	0	1.05	1.76	1.92	4.5
Belgium	8.16	44	0.4	3.63	2.99	5.0
Canada	2.80	22	−2.05	12.57	−4.84	5.0
Denmark	4.58	78	1.33	0.65	2.54	2.0
Finland	5.01	100	1.08	3.15	5.64	2.0
France	2.92	100	−1.81	19.98	−1.90	1.3
Germany	3.35	0	1.74	3.00	1.21	5.0
Greece	2.25	0	−1.4	7.76	0.69	1.0
Iceland	3.65	0	1.78	1.44	2.84	1.0
Ireland	3.18	33	−2.2	6.45	2.65	1.0
Italy	5.73	78	1.43	6.67	0.43	1.5
Japan	2.94	100	1.36	9.68	−3.38	2.0
Luxembourg	4.12	0	−1.89	3.38	0.52	1.0
Netherlands	4.98	44	0.45	1.01	0.75	3.0
New Zealand	3.65	89	−1.85	2.61	−5.32	1.0
Norway	4.85	89	0.49	3.25	3.47	2.0
Portugal	2.58	22	−0.25	5.22	1.66	1.0
Spain	2.56	56	0.83	5.68	−0.39	3.0
Sweden	4.18	100	1.32	1.00	2.84	2.0
Switzerland	5.22	100	0.32	2.93	−1.79	5.0
UK	2.15	0	−1.92	17.1	−4.78	2.5
USA	2.01	0	2.17	2.52	−6.17	5.0

Appendix 1. *(Continued)*

Country	State and local taxes in total tax revenue (%)	Index of bicameralism	Index of constitutional rigidity	Index of judicial review	Index of central bank independence	Index of direct democracy
Australia	22.4	4	8	2	2.66	2.5
Austria	20.9	2	3	2	6.86	2
Belgium	14.1	3	9.5	2	6.29	0
Canada	44.1	3	7	2	2.33	0
Denmark	31.2	1	8	1	4.99	3.0
Finland	23.0	1	4	1	7.16	1
France	9.9	3	4	2	6.83	1
Germany	29.1	4	6	2	6.83	0
Greece	1.2	1	5	1	6.68	0
Iceland	20.8	1	8	1	5.08	0.5
Ireland	2.3	2	4	1	6.72	2
Italy	5.4	3	4	2	6.97	4.5
Japan	24.9	3	8	1	4.41	0.5
Luxembourg	7.6	1	5	0	6.77	0
Netherlands	2.6	3	8.5	0	6.81	0.5
New Zealand	5.7	1	1	0	4.99	2.5
Norway	19.6	1.5	3.5	1	3.41	0
Portugal	5.6	1	3	1	6.83	0.5
Spain	13.8	3	6	2	6.66	2
Sweden	31.8	1	4	1	6.91	1.5
Switzerland	36.1	4	7	0.67	6.52	7.5
UK	4.1	1.75	1	0.33	3.66	0
USA	32.1	4	9	2	3.83	0

Appendix 1. *(Continued)*

Country	First dimension (parties–interest groups)	Second dim. (federal–unitary)	Third dim. (cabinets–direct democracy)	Country	First dimension (parties–interest groups)	Second dim. (federal–unitary)	Third dim. (cabinets–direct democracy)
Australia	–1.58	1.40	–0.14	Japan	–0.64	0.39	0.55
